

# Omega Cross-Section

---

Martin Sobotzik

Mainz, March 2019

Institute for Nuclear Physics  
Johannes Gutenberg University of Mainz

Olis Cross Section; Dip at about  $\cos(\theta) = -0.3$

Increased number of bins to 40; now there is still a dip at  $\cos(\theta) = -0.3$  but also a peak at  $\cos(\theta) = -0.5$

Both Cross Sections are shown.

$$\omega \rightarrow \gamma \pi^0$$

$\downarrow$   
 $\gamma\gamma$

Closer look at:

- $\omega$
- $\pi^0$
- Proton
- Bachelor Photon
- $\gamma\gamma$

# Energy of Proton for $\cos(\theta_\omega) = [-0.45, -0.35]$ (Peak)

E (lab) Proton

E (lab) Proton

Energy of protons for  $\cos(\theta_\omega) = [-0.45, -0.35]$ . Red are MC and blue are

beamtime data. Left side is just measured, right side is after KFit.

# $\theta$ of Proton for $\cos(\theta_\omega) = [-0.45, -0.35]$ (Peak)

$\theta_p$  (lab)

$\theta_p$  (lab)

$\theta$  of protons for  $\cos(\theta_\omega) = [-0.45, -0.35]$ . Red are MC and blue are beamtime data. Left side is just measured, right side is after KFit.

# Energy of Protons for $\cos(\theta_\omega) = [-0.35, -0.25]$ (Dip)

E (lab) Proton

E (lab) Proton

Energy of protons for  $\cos(\theta_\omega) = [-0.35, -0.25]$ . Red are MC and blue are beamtime data. Left side is just measured, right side is after KFit.

# $\theta$ of Proton for $\cos(\theta_\omega) = [-0.35, -0.25]$ (Dip)

$\theta_p$  (lab)

$\theta_p$  (lab)

$\theta$  of protons for  $\cos(\theta_\omega) = [-0.35, -0.25]$ . Red are MC and blue are beamtime data. Left side is just measured, right side is after KFit.

$\cos(\theta_{fit})$  vs.  $\cos(\theta_{gen})$  for all protons.

$\cos(\theta_{fit})$  vs.  $\cos(\theta_{gen})$  for all  $\omega$ .

# Unfolding

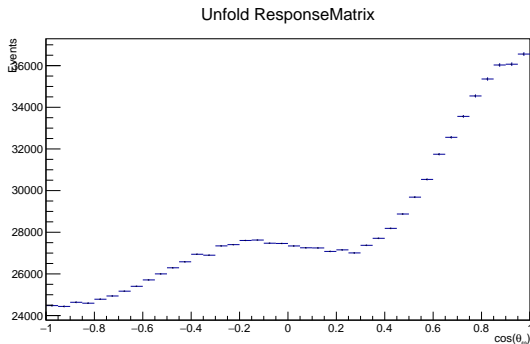

---

- $\mu$  is the *true* distribution given by nature
- detector effects are then described by the response function  $R$ .  
(inefficiencies, bias and smearing)
- This results in the distribution  $\nu$ .

$$\nu_i = \sum_{j=1}^M R_{ij} \mu_j$$

- With infinite statistics, it would be possible to recover the original distribution by inverting the response matrix

$$\mu = R^{-1} \nu$$

Flat  $\omega$  was used. MC fitted data were folded.
